Types of Fluid Mechanics Multiple Choice Questions and Example Problems

Fluid mechanics MCQs can cover a broad spectrum of topics, ranging from basic definitions to complex applications of governing equations. Here are some examples categorized by topic:

1. Fluid Statics:

- **Question:** A rectangular block of wood floats in water with $\frac{2}{3}$ of its volume submerged. What is the density of the wood relative to water?
- a) $\frac{1}{3}$
- b) $\frac{2}{3}$
- c) $\frac{3}{2}$
- d) 1

Answer: b) $\frac{2}{3}$ (The buoyant force equals the weight of the displaced water, which is equal to the weight of the wood. Therefore, the ratio of the wood's density to water's density is the ratio of submerged volume to total volume).

2. Fluid Dynamics:

- **Question:** According to Bernoulli's principle, an increase in the speed of a fluid results in:
- a) An increase in pressure
- b) A decrease in pressure
- c) No change in pressure
- d) An increase in density

Answer: b) A decrease in pressure (Bernoulli's principle states that an increase in fluid speed is accompanied by a decrease in pressure).

3. Dimensional Analysis:

- **Question:** What are the dimensions of dynamic viscosity?
- a) $ML^{-1}T^{-1}$
- b) $ML^{-1}T^{-2}$
- c) $ML^{-2}T^{-1}$
- d) MLT^{-1}

Answer: a) $ML^{-1}T^{-1}$ (This can be derived from the shear stress equation: $\tau = \mu(du/dy)$, where τ has dimensions of pressure ($ML^{-1}T^{-2}$), and du/dy has dimensions of T^{-1}).

4. Navier-Stokes Equations:

- **Question:** The Navier-Stokes equations describe the motion of which type of fluids?
- a) Ideal fluids only
- b) Viscous fluids only
- c) Both ideal and viscous fluids
- d) None of the above

Answer: c) Both ideal and viscous fluids (The Navier-Stokes equations are a set of partial differential equations that describe the motion of viscous fluids. They can be simplified to describe ideal fluids by setting the viscosity term to zero).
