Frequently Asked Questions (FAQs)

Q1: What is the difference between TEM and SEM?

A1: Transmission electron microscopy (TEM) transmits electrons through a thin sample to form an image, revealing internal structures. Scanning electron microscopy (SEM) scans the surface of a sample with a focused electron beam, generating images based on the emitted electrons, providing high-resolution surface details.

Q2: How does cryo-EM work?

A2: Cryo-EM rapidly freezes a biological sample in a thin layer of vitreous ice, preserving its native structure. The frozen sample is then imaged using an electron microscope, and numerous images are computationally combined to reconstruct a 3D model of the sample.
