Common Gravely Walk-Behind Sickle Bar Parts and Their Functions

The Gravely walk-behind sickle bar mower comprises numerous crucial parts. Understanding their function is key to effective maintenance and troubleshooting. Let's examine some key components:

- **Sickle Bar Blades:** These are the cutting edges, and their sharpness directly impacts the quality of your cut. Regular sharpening or replacement is crucial. The manual will detail blade sharpening techniques and replacement procedures. Dull blades lead to ragged cuts and increased wear on the rest of the system.
- **Knife Guard:** This protects the operator from the spinning blades and prevents damage to the blades from stones or other debris. The manual will provide instructions on its proper installation and maintenance. A damaged or improperly installed knife guard poses a serious safety hazard.
- **Drive Mechanism:** This transmits power from the engine to the sickle bar. The parts manual will show the components like belts, pulleys, and the gearbox, outlining their function and adjustment procedures. A properly functioning drive mechanism ensures smooth and efficient operation.
- **Gearbox (Transmission):** This reduces the engine speed to the appropriate speed for the sickle bar and contains important internal gears and bearings. Understanding the gearbox's functionality, as detailed in the manual, will help you troubleshoot potential problems efficiently. A worn gearbox can affect cutting performance significantly.
- **Pitman Arm and Connecting Rod:** These link the drive mechanism to the sickle bar, transmitting the rotary motion. These parts are often subject to wear and tear and should be carefully inspected as per instructions in the manual.
- **Clutch Assembly:** This allows for the engagement and disengagement of the sickle bar, a safety feature to help prevent injury. Regular inspection and adjustment are vital.

- **Drive Shaft and Bearings:** These components provide smooth operation and transfer power from the gearbox to the sickle bar. The manual will detail their lubrication and inspection requirements. Worn bearings cause noisy and inefficient operation.
