Mastering the Nikon D700: Exposure Modes and Settings

Understanding the D700's exposure modes is crucial for achieving well-exposed photographs. Let's delve into the key modes offered by this camera:

Aperture Priority (A):

In Aperture Priority mode, you control the aperture (f-stop), determining depth of field, while the camera automatically selects the shutter speed. This is ideal for portraits, where you might prioritize a shallow depth of field to blur the background.

Shutter Priority (S):

Shutter Priority mode allows you to control the shutter speed, influencing motion blur. This is beneficial for freezing fast action (sports, wildlife) or creating motion blur for artistic effect (waterfalls, light trails). The camera automatically selects the aperture.

Manual Mode (M):

In Manual mode, you have complete control over both aperture and shutter speed. This provides maximum creative freedom but requires a good understanding of exposure concepts. This mode is perfect for experienced photographers who want precise control over their images.

Program Mode (P):

Autofocus System and Metering Modes: A Quick Guide

The Nikon D700's Multi-CAM3500FX autofocus system provides accurate and reliable focusing. Its 51 autofocus points offer excellent coverage, enabling you to focus accurately even on off-center subjects. The camera also features various metering modes:

- **Matrix Metering:** Evaluates the entire scene for optimal exposure.
- **Center-Weighted Metering:** Prioritizes the center area of the frame for exposure calculation.
- **Spot Metering:** Measures the light in a small, specific area.
